Big Data IDE Portable Crack + [Latest] 2022

Database migration - migrate your database to another one. First time start - creating database connection and user. SQL scripts creation and saving as templates. Query history - review your last queries. Syntax highlighting. Database cleaning - make sure your database is ready to work. Schema objects creation - create different objects for your database. Database schema management - modify database schema objects. Create SQL scripts for all objects. Triggers - create database triggers. As you can see from the screen shot above, the Database Migration function of the app helps you easily migrate your databases from one type to another, with the proper modification of all your tables. You can also perform a limited number of other activities that include converting, merging and splitting your databases. Import/export templates for the database objects The user interface of the program is made up of a structure comprising an object explorer that is listed under the main window. Then, there is a tab called "Explorer" on the left that lets you manage your objects. It includes all the options and fields you can see in the screenshot below. The other tabs include the "Welcome" tab, with all the functions and options you need to have a smooth installation process. Then, there is the "Database Schemas" tab, which shows you the connection string and all the objects you can find in the database. The last tab is the "Query Editor" tab, which lets you edit your SQL scripts; an important part of the software. You can create new scripts using the "New script" option. The way the scripts are created is interesting as the utility enables you to use the existing objects in the database or to provide a complete new set of objects and fields. Database migration Another important tool you will be interested in is the Database Migration. Using it, you can easily change the structure of your database. For instance, you can add new fields to a table, change the types of your fields or perform minor changes like the adding of or modification of a field. The Migration tool is accessible via a "Database migration" tab on the left side of the screen. Once you click on this option, a window with two tabs appears on the right side of the interface, with the "Scripts" and "Objects" tabs. Now, if you select the "Scripts" tab, a window opens, where you can find the scripts. These scripts can be used for the database migration, since they

KeyMacro is a simple and reliable tool that has proven to be indispensable in data mining projects, as it allows users to simplify the process of key creation. What it can do:

- Key creation for different data sources (relational databases, Big Data, cloud-based data, etc.);
- Key creation for different data types (numerical, categorical, characters, etc.);
- Key creation for different columns;
- Automatic key creation (you will be able to select the columns to be used for creating the keys);
- Allows you to add unique indexes to the fields to be used for key creation (and, optionally, to add key information to these fields);
- Allows you to specify the length of each field;
- Allows you to select the maximum number of characters in each field;
- Allows you to select the number of digits in the numeric fields and add it to the key;
- Allows you to select whether to create a primary key or a non-unique key;
- Allows you to add and edit key information;
- Allows you to create a record for each field of the key in a specified output file.
- Allows you to export your key in a format that is readable by Excel;
- Allows you to create charts (Line, Bar, Area) for each field of the key. KEYMACRO allows you to create various types of keys, such as numeric, categorical, numeric and character keys;
- A categorical key represents a set of values of a given variable that can be extracted from the data using a single number.
- A numeric key is a number created using a set of numeric variables, or factors.
- A numeric key can be used to access a key;
- A numeric key can be used to create a Line chart or a Bar chart;
- A numeric key can be used to create a tabular;
- A character key is a string created from a set of characters that can be extracted from the data.
- A categorical key can be used to create a Line chart or a Bar chart.
- A categorical key can be used to create a tabular.
- A numeric key can be used to create a Line chart or a Bar chart.
