How To Work With Layers You've probably seen a lot of Photoshop tutorials on the web and in print talking about layers and how to use them. Basically, a layer is a thin piece of paper that sits on top of the layers below it. The layer is the primary way you work with your images. You can add an adjustment layer, change the opacity of a layer, or you can paint on a layer to create an effect. Most of the time, you will use the Layers panel to create, move and create in different layers. This panel can be found under the File menu > Layers. In Photoshop Elements you can have multiple layers, but we will only look at one. Layers is the place where you will add, move, combine, and generally work with your

A comparison of the discriminative stimulus effects of (-)-4-bromo-2,5-dimethoxyamphetamine (dibromomethamphetamine). The discriminative stimulus effects of 8.4 mg/kg (+/-)-4-bromo-2,5-dimethoxyamphetamine (dibromomethamphetamine) were compared with those of a single dose of d-amphetamine. Both drugs were highly selective for the discriminative stimulus effects of d-amphetamine. The potency of dibromomethamphetamine, in terms of its ability to substitute for d-amphetamine, was about 1/10 that of d-amphetamine. Both compounds were self-administered by rats under a second-order fixed-ratio 1 schedule of reinforcement at dose levels similar to those that substituted for d-amphetamine. Rats trained with dibromomethamphetamine self-administered the drug at levels similar to those that substituted for d-amphetamine. The drug was also self-administered by squirrel monkeys. Under some conditions of training, dibromomethamphetamine was self-administered by rats at doses well above those that substituted for d-amphetamine. Squirrel monkeys also self-administered the drug at doses that substituted for d-amphetamine. The ED50S of dibromomethamphetamine for self-administration by rats was approximately 5 mg/kg (i.e., about 200 times the ED50S for d-amphetamine self-administration). These findings support the hypothesis that dibromomethamphetamine has the pharmacological properties required for the development of a drug abuse liability.
